

Real or Fake? State Who You Are, and How You Want AI to Be Utilised

by Chris Moncuso

Good information is the ONLY thing that matters in any society.

Why?

If everyone has the same information, and all information is available, accurate, and current, then society as a whole makes the decisions of where society will go and what it will accept.

There is no such thing as corruption if everyone in the society has access to the same available, accurate, and current information; this is because if society has the information about what is going on, and accepts it as a whole, then it is not corruption, it is accepted. For example, if everyone in a society knew there were hackers blocking and harassing people using the internet in targeted acts of sabotage, and if everyone in society knew who they were, the hackers would get killed or arrested and stopped. The corruption wouldn't exist because too many people would know and it would be corrected to what society wants. Another example is if someone was targeting a single person and spying on them, it would need to be an attack on the person being spied on because society would have all of the information about what is going on and is perhaps killing off or targeting to arrest someone, such as the hackers that were known to be hacking. The spying wouldn't be accepted by society for any other reason because the information would not be the most available, accurate, and current. Why? Because focusing on that single person is out of context and less accurate than the information available about the person by the person. The most available, accurate, and current information about the person would be for the person to disclose the appropriate information about himself given the proper context, perhaps disclosing situationality involved, and to the proper audience. The way information is updated to keep most current, available, and accurate, involving what we call today as AI and the ability to gather the most relevant summarised information about something of interest, is the most important societal market and business of the future. The next level in evolution from the search engine that now provides more trusting information, which will be a market of those hoping to provide information that is the most available, accurate, and current: AI. Though who are you? Real or fake? I currently have a job doing coding for an AI company, and as I am writing this, I am pushing back starting a project I was given that involves coding animation, an area that I never had interest in, nor wanted anything to do with. I know who I am, and I ask who are you. I am real, and I want the best real information. In fact during my live interview, my response of why I want to join the AI company, as a member of the LATAM Coders Program, after going through an extensive amount of assessments in areas of logic, coding, and communication, was that I believe in the evolution of open communication. Would you prefer a fake world instead, and perhaps utilise AI for graphics and entertainment that can be used to deceive and cause information of society to be less accurate? The key is always to realise, don't restrict an advancement of human "invention" because the answer is always to adapt and evolve past issues, even if what is being invented is perceived as potentially harmful or overutilising finite resources, as these inventions are inevitable anyway, and the markets of a society given open information that is available, accurate, and current will handle the potential harm to themselves, and can innovate past the potential overutilisation of resources to their points of depletion. Look at it this way, if people invented AI graphics that nobody wants because it is negative value in that it tricks us between real and fake, and people want to know if what they are watching is real, such as real capabilities or real discoveries of the real universe, then it isn't accurate information, and the markets won't choose it, but don't stop it; instead, let the markets handle it, as I want to know and see that the technology can exist that can create a video of someone doing something that I may have had no reason to think may have not been real, but now I know that it can be fake and we can factor that into our absorbiveness, decision making, and overall perception of the universe, and if for no other reason than the reasonable doubt for when we kill the hackers. UPDATE, JULY 2025: Just kidding. I got put in a looney bin for 8 days for using the 'k' word after posting this. I decided to submit a travel request and fly into a very soviet conformist town in USA where my mother lives, and police showed up at her house because of me typing "threatening" words like the "k" word while talking about theoretical responses to potential attacks on US citizens using hacking and targeting war technology.
